Liaqat Ali, Summer 2018.
Course Topics

1. General introduction
2. Algorithms, flow charts and pseudocode
3. Procedural programming in Python
4. Data types and Control Structures
5. Binary encodings
6. Fundamental algorithms
7. Basics of (Functions and) Recursion (Turtle Graphics)
8. Basics of computability and complexity
9. Subject to time availability:
   ▫ Basics of Data File management

Liaqat Ali, Summer 2018.
Today’s Topics

1. Turtle Graphics: Drawing and Animation
2. Introduction to Functions: User-defined
3. Defining and Calling a Void Function
4. Designing a Program to Use Functions
5. Passing Arguments to Functions
6. Case Study: Developing Software Using Functions
Designing a Program to Use Functions

Liaqat Ali, Summer 2018.
Designing a Program to Use Functions

- In a flowchart, function call shown as rectangle with vertical bars at each side
  - Function name written in the symbol.
  - Typically draw separate flow chart for each function in the program
    - End terminal symbol usually reads Return.

- **Top-down design**: technique for breaking algorithm into functions
Designing a Program to Use Functions (cont’d.)

- **Hierarchy chart**: depicts relationship between functions
  - AKA structure chart
  - Box for each function in the program, Lines connecting boxes illustrate the functions called by each function
  - Does not show steps taken inside a function

- **Use `input` function** to have program wait for user to press enter.
Designing a Program to Use Functions (cont’d.)

Local Variables

- **Local variable**: variable that is assigned a value inside a function
  - Belongs to the function in which it was created.
  - Only statements inside that function can access it, error will occur if another function tries to access the variable.

- **Scope**: the part of a program in which a variable may be accessed
  - For local variable: function in which created.
Local Variables (cont’d.)

- Local variable cannot be accessed by statements inside its function which precede its creation.
- Different functions may have local variables with the same name
  - Each function does not see the other function’s local variables, so no confusion.
Passing Arguments to Functions

- **Argument**: piece of data that is sent into a function.
  - Function can use argument in calculations.
  - When calling the function, the argument is placed in parentheses following the function name.
Passing Arguments to Functions (cont’d.)

```python
def main():
    value = 5
    show_double(value)

def show_double(number):
    result = number * 2
    print(result)
```

Liaqat Ali, 2018: Adapted from: Copyright © 2018 Pearson Education, Inc.
Passing Arguments to Functions (cont’d.)

- **Parameter variable**: variable that is assigned the value of an argument when the function is called.
  - The parameter and the argument reference the same value
  - General format:
    ```python
def function_name(parameter):
```
- **Scope of a parameter**: The function in which the parameter is used.
Passing Arguments to Functions (cont’d.)

```python
def main():
    value = 5
    show_double(value)

def show_double(number):
    result = number * 2
    print(result)
```
