## CMPT-225 Jan Manuch

## Recommended Labs - Monday, June 19, 2006

The goal of this lab is to get you familiar with big O notation.
a) Prove the third rule of big O notation arithmetic (by using definition of big O notation). That is prove that if $f_{1}(n)$ is of order $O\left(g_{1}(n)\right)$ and $f_{2}(n)$ is of order $\mathrm{O}\left(\mathrm{g}_{2}(\mathrm{n})\right)$ then $\mathrm{f}_{1}(\mathrm{n}) * \mathrm{f}_{2}(\mathrm{n})$ is of order $\mathrm{O}\left(\mathrm{g}_{1}(\mathrm{n}) * \mathrm{~g}_{2}(\mathrm{n})\right)$.
b) On the lecture we said that the constants can be ignored. However, not all constant can be ignored. By the first rule that $\mathrm{f}(\mathrm{n})$ and $\mathrm{c} * \mathrm{f}(\mathrm{n})$ have the same order, i.e., the multiplicative constant in the front of the function can be ignored. Is it true that

1) $\mathrm{n}^{\mathrm{c}}$ and $\mathrm{n}^{\mathrm{d}}$ have the same order (when $\mathrm{c}<\mathrm{d}$ are constants greater than 0 )?
2) $\mathrm{c}^{\mathrm{n}}$ and $\mathrm{d}^{\mathrm{n}}$ have the same order (when $\mathrm{c}<\mathrm{d}$ are constants greater than 1 )?
3) $2^{\mathrm{cn}}$ and $2^{\mathrm{dn}}$ have the same order (when $\mathrm{c}<\mathrm{d}$ are constants greater than 0 )?

Either prove that they have the same order (using the definition of big O notation), or show that the function with $d$ is not of order of the function with $c$. (Of course, it is always true that the function with c (remember $\mathrm{c}<\mathrm{d}$ ) is of order of the function with d.)
