

**CMPT 886**  
**Stream Merging Algorithms**

Akiko Campbell

Presentation -1

Summer/2004

# Agenda

- Background
- Basic Mechanism
- Performance Comparisons
- Representative Algorithms
  - Fibonacci Tree Algorithm
  - Dyadic Tree Algorithm
- Extension
- Conclusion

# Background

- What is Stream Merging?
  - Technique to deliver media in multiple streams, using multicast and client buffers.
- Basic Idea
  - Medium: partitioned into equally-sized units.
  - Server: sends each client a “Client Receive Program”.
  - Clients: pre-receive and store data in buffers.
  - Streams: terminated asap.
- Objective
  - Reduce server bandwidth by having clients receive two or more streams simultaneously and terminate streams as soon as there are no needs for them.

# Background

- Properties
  - On-line
  - Zero Delay
  - Receive-Two Model
  - Client Buffer size: up to half the medium

# Background

- Stream Merging Models
  - Merge Tree Based Model
    - Fibonacci Tree Algorithm
    - Dyadic Tree Algorithm
      - 2-dyadic
      - $\phi$ -dyadic
  - Event-Driven Model

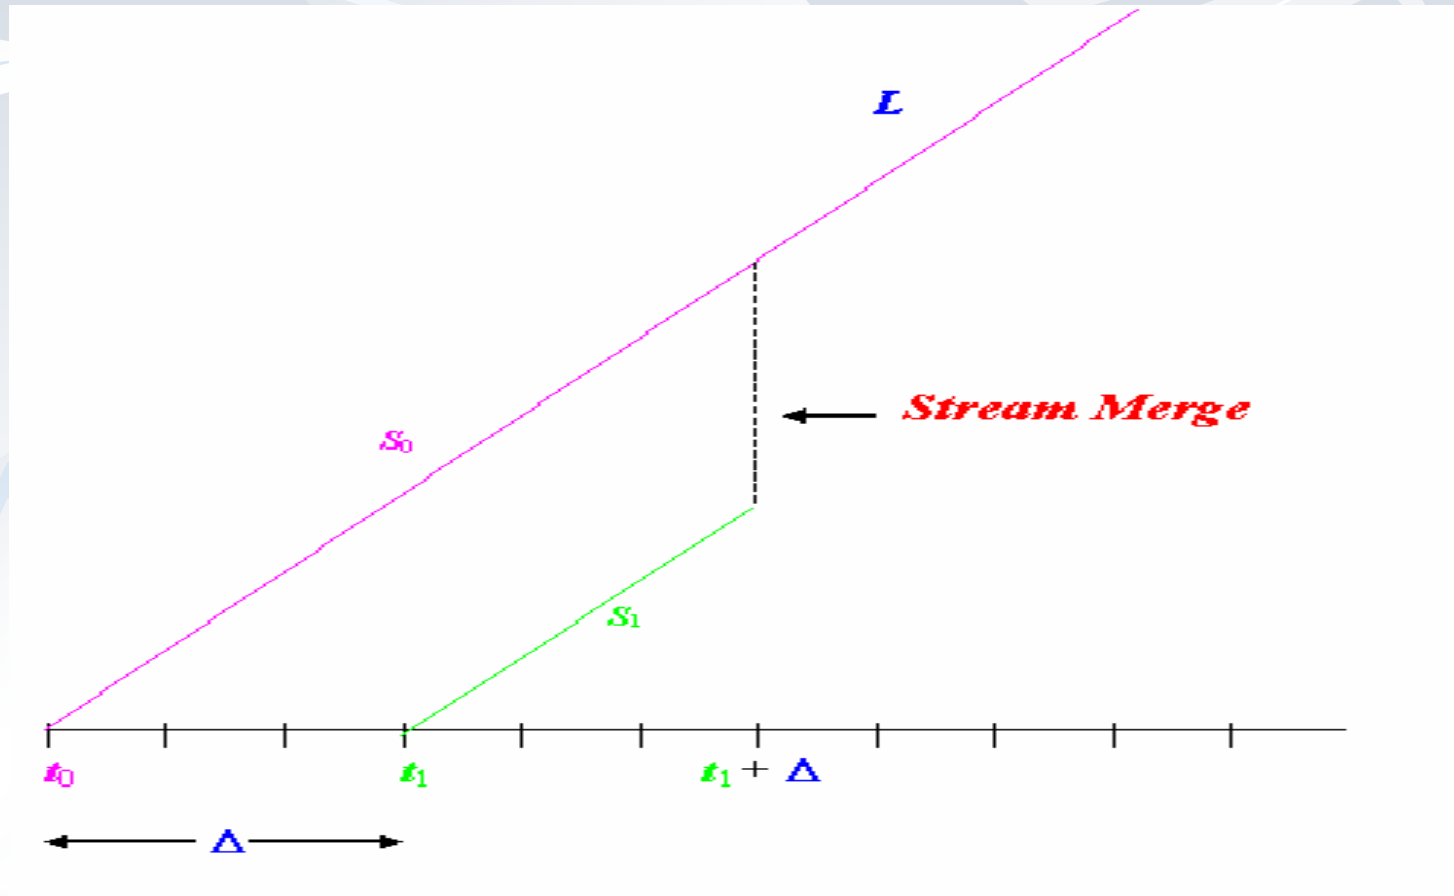

# Basic Mechanism

## ■ Idea

- Client  $C_1$  arrives at time  $t_1$  and requests a video of duration  $L$ .
- Client  $C_0$  is currently playing the same video from stream  $S_0$  that began at time  $t_0 < t_1$ .
- $C_1$  missed the first  $\Delta = t_1 - t_0$  time units.
- $C_1$  receives  $\Delta$  from  $S_1$ .
- At the same time,  $C_1$  receives  $L - \Delta$  from  $S_0$ .
- Terminate  $S_1$  after  $\Delta$  time units (*Stream Merge*).

# Basic Mechanism

- Concrete Merge Diagram

# Basic Mechanism

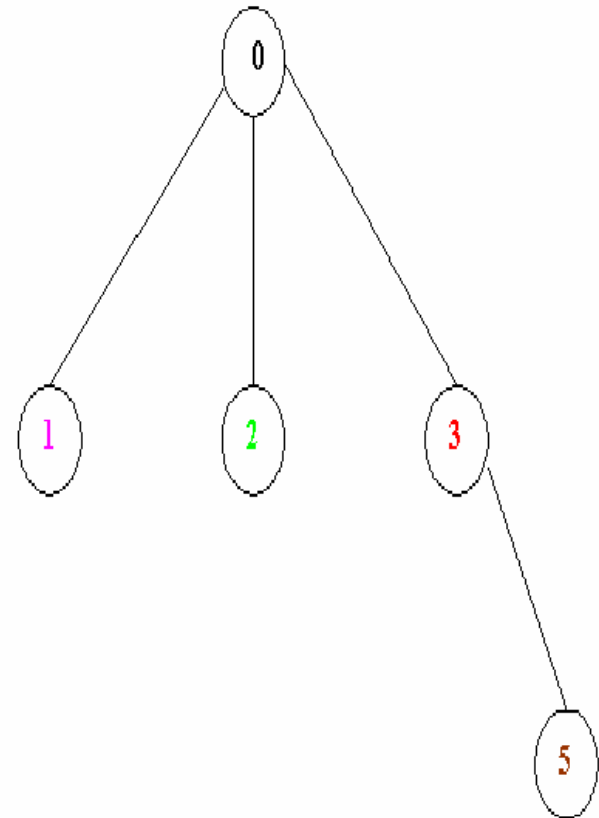

- Total Data Capacity Required
  - Sum all stream lengths
  - Example:
    - $S_0 = 10$  for  $C_0$
    - $S_1 = 5$  for  $C_1$
    - $S_2 = 2$  for  $C_2$
    - $S_3 = 1$  for  $C_3$
  - **Total Capacity = 18**

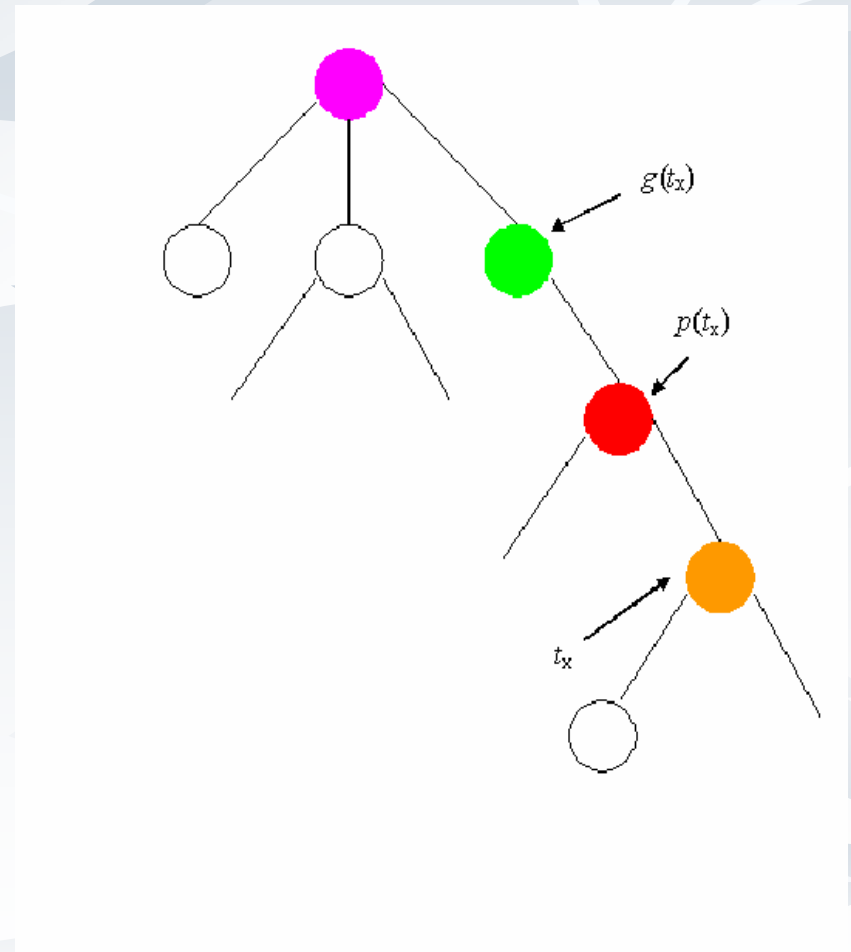

# Basic Mechanism

- Merge Tree
  - Alternative to Concrete Merge Diagram.
  - Each node is labeled with client's arrival time.
  - Root: full stream length
  - Example:
    - $C_1$  arrived at time 1
    - $C_2$  arrived at time 2
    - $C_3$  arrived at time 3
    - $C_4$  arrived at time 5

# Basic Mechanism

- Merge Tree
  - Client  $C_x$  receives from stream started at times  $t_x$  and its parent  $p(t_x)$ .
  - Stream started at  $t_x$  terminates.
  - $C_x$  continues to receive from  $p(t_x)$  and grandparent  $g(t_x)$ .

# Basic Mechanism

- Merge Tree: Determining performance...

**Total Data Capacity Required = Sum of All Stream Lengths**

- Length of a Stream:  $l(x)$

Non-leaf:  $l(x) = 2z(x) - x - p(x)$

Leaf:  $l(x) = x - p(x)$

- Where

- $p(x)$  = parent of node  $x$
- $z(x)$  = the latest node in the sub-tree rooted at  $x$

# Performance Comparisons

- How to Merge?
  - Merge decisions affect performance...
  - Example Scenario
    - Medium Length: 20
    - Arrival Times:  $t = [0, 4, 5, 6, 9]$
  - Total Capacity?
    - Fibonacci: 44
    - 2-dyadic: 42
    - $\phi$ -dyadic: 40

# Performance Comparisons

## ■ Fibonacci: 44

- $l(\text{Root})$ : 20
- $\Sigma l(\text{Non Leaf})$ : 12  
 $2*9 - 6 - 0$
- $\Sigma l(\text{Leaf})$ : 12  
 $(4-0) + (5-0) + (9-6)$

## ■ Total Capacity: 44

# Performance Comparisons

- 2-dyadic: 42

- $l(\text{Root})$ : 20
- $\Sigma l(\text{Non Leaf})$ : 18  
 $(2*5 - 4 - 0) + (2*9 - 6 - 0)$
- $\Sigma l(\text{Leaf})$ : 4  
 $(5-4) + (9-6)$

- Total Capacity: 42

# Performance Comparisons

- $\phi$ -dyadic: 40
  - $l(\text{Root})$ : 20
  - $\Sigma l(\text{Non Leaf})$ : 8  
 $2*6 - 4 - 0$
  - $\Sigma l(\text{Leaf})$ : 12  
 $(5-4) + (6-4) + (9-0)$
- Total Capacity: 40

# Performance Comparisons

- Shape of the tree determines the algorithm performance...
- What does the tree shape signify?
  - Merge Decisions.
  - Policy for creating Client Receive Program.
- How are the Tree Shapes determined?

# Representative Algorithms

- Merge Tree Based Models
  - Fibonacci Tree Algorithm – worst case analysis
  - Dyadic Algorithm – average case analysis

# Representative Algorithms

- Fibonacci vs. Dyadic

- Common:

- Based on Merge Trees.
    - Stream lengths can change at any time.
    - No change in Client Receive Program.
    - Heuristically start a new root.

- Difference:

- Policy for creating Client Receive Program.

# Representative Algorithms

## Fibonacci Tree Algorithm

- Fibonacci Tree Refresher: formal definition

A *Fibonacci tree* is a variety of binary tree restricted to have a special structure, which is defined recursively as:

- The empty tree is a *Fibonacci tree of order 0*.
- A tree with a single node is a *Fibonacci tree of order 1*.
- For  $n > 1$ , a *Fibonacci tree of order  $n$*  consists of a root node, a left subtree that is a *Fibonacci tree of order  $n-1$* , and a right subtree that is a *Fibonacci tree of order  $n-2$* .

# Representative Algorithms

## Fibonacci Tree Algorithm

- Fibonacci Tree Refresher: Examples

Fibonacci Tree of order 0:

Fibonacci Tree of order 1:

Fibonacci Tree of order 2:

Fibonacci Tree of order 3:

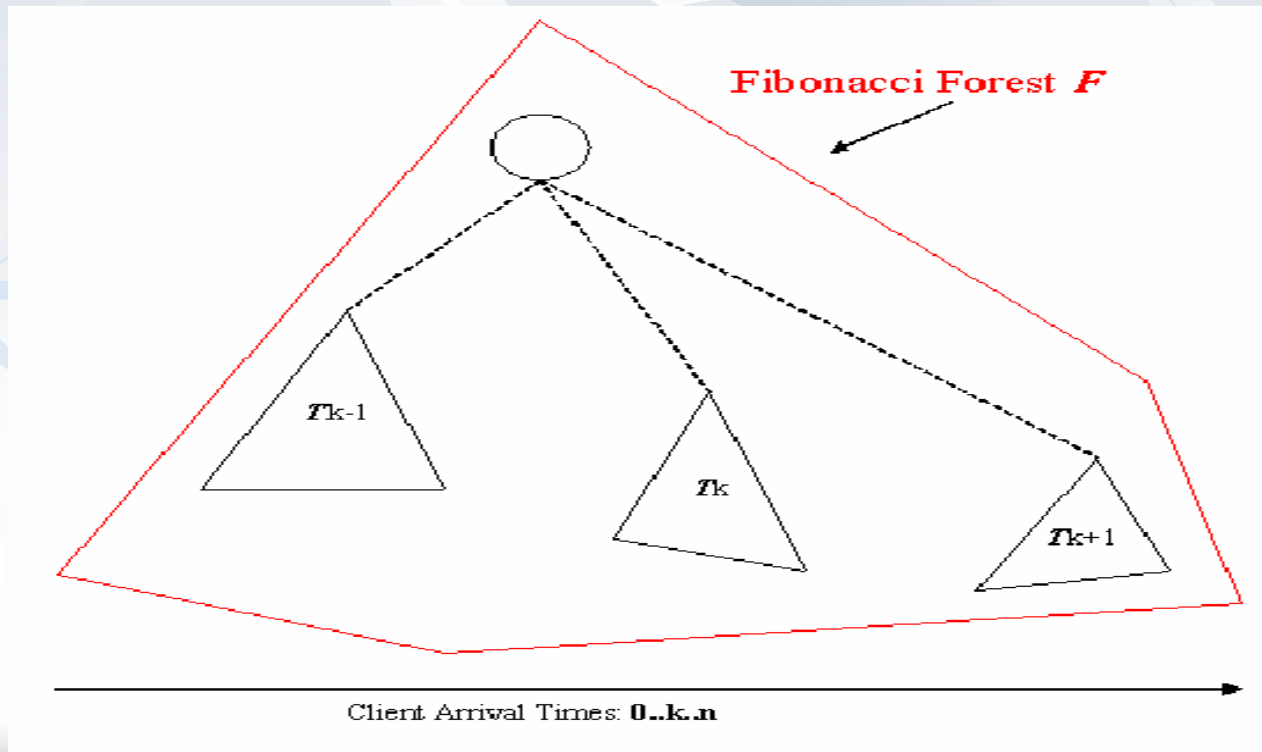

Fibonacci Tree of order 4:

# Representative Algorithms

## Fibonacci Tree Algorithm

- Fibonacci Tree properties
  - Infinite
  - Preorder

# Representative Algorithms

## Fibonacci Tree Algorithm

- What to do with the new arrival...
  - Add to an existing tree?
  - Root of a new tree?
- Start Rule
  - Client  $C_n$  arrives at  $t_n$ 
    - Medium Length:  $L$
    - Forest:  $F$
    - $t_m$  : root of the last tree in  $F_{n-1}$
  - If  $t_n - t_m > L/2$ :  $t_n \rightarrow$  new root

# Representative Algorithms

## Fibonacci Tree Algorithm

### ■ Start Rule Example

- Medium Length: 20

- Client arrival times:  $t[0, 4, 5, 6, 9, 11, 19]$

- Distance ( $t_n - t_m$ ):

- $t[0]$ :  $\rightarrow$  create a tree  $T_0$

- $t[4, 5, 6, 9]$ :  $(4-0)\dots(9-0) < 20/2 \rightarrow$  add to  $T_0$

- $t[11]$ :  $(11-0) > 20/2 \rightarrow$  new tree  $T_{11}$

- $t[19]$ :  $(19-11) < 20/2 \rightarrow$  add to  $T_{11}$

# Representative Algorithms

## Fibonacci Tree Algorithm

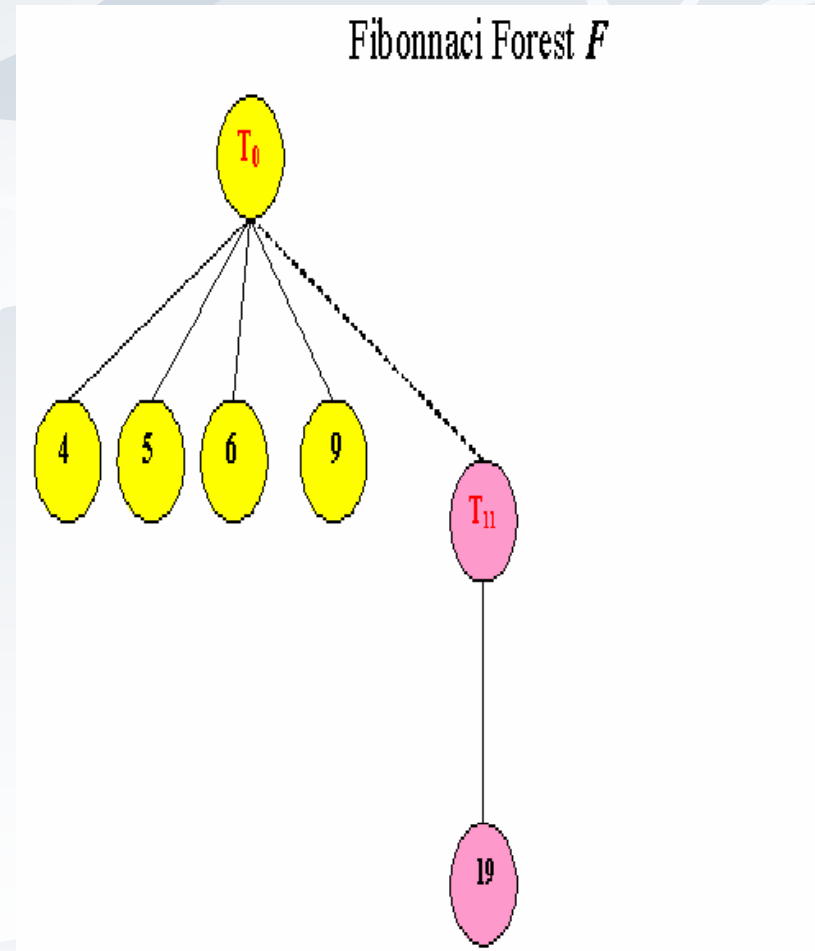

### ■ Start Rule Example

Fibonacci Forest  $F$

- Create  $T_0$ .
- Create  $T_{11}$  and connect with  $T_0$ .

### ■ Merging Rules

- Basic Merging Rule
- Nearest Fit Rule
- Best Fit Rule

# Representative Algorithms

## Fibonacci Tree Algorithm

### ■ Merging Rules: *Basic Merging Rule*

- Node to connect to: which node can be the parent of the new root?

### ■ Parameters

- New root:  $t_n$
- Merge Tree:  $F_{n-1}$
- $t_n + F_{n-1} \rightarrow F_n$
- Right Frontier of  $F_{n-1}$ :  $t_1 = node_0, \dots, node_i, \dots, node_k = t_{n-1}$
- $node_i$  on Right Frontier of  $F_{n-1} \rightarrow$  parent of  $t_n$

# Representative Algorithms

## Fibonacci Tree Algorithm

- Merging Rules: *Basic Merging Rule*

*Not all nodes eligible parents...*

- $S_i$  = Stream started at *node* <sub>$i$</sub>
- $S_i$  ( $i > 0$ ) terminated before  $t_n$ ?
  - $S_i$  terminates at  $t_i + l(S_i)$ .
  - $l(S_i) = 2t_k - t_i - t_{i-1} \rightarrow t_i + l(S_i) = t_i + (2t_k - t_i - t_{i-1}) = 2t_k - t_{i-1}$
- *node* <sub>$i$</sub>  to be a parent...
  - $t_n \leq 2t_k - t_{i-1}$

# Representative Algorithms

## Fibonacci Tree Algorithm

### ■ Merging Rules: *Basic Merging Rule*

Right Frontier of  $F_{n-1}$ :  $t_1 = node_0, \dots, node_i, \dots, node_k = t_{n-1}$

■  $node_i : i = 0$

■  $F_n = F_{n-1}^0$

■  $node_i : i > 0$

■  $F_n = F_{n-1}^i (t_n \leq 2 t_{n-1} - t_{i-1})$

# Representative Algorithms

## Fibonacci Tree Algorithm

- Merging Rules: *Basic Merging Rule*

- Basic Merging Rule

- Property of the candidate parent.

- But not how to pick a parent...

- Nearest Fit Rule

- Best Fit Rule

# Representative Algorithms

## Fibonacci Tree Algorithm

- Merging Rules: *Nearest Fit Rule*
  - Pick a parent closest to the new arrival.
  - $node_i$ : the parent of  $t_n$  where  $i$  is as large as possible.

Right Frontier of  $T_{n-1}$ :  $t_1 = node_0, \dots, node_i, \dots, node_k = t_{n-1}$

→ Pick largest  $i$  ( $1 \leq i \leq k$ ) s.t.  $t_n \leq 2 t_{n-1} - t_{i-1}$

# Representative Algorithms

## Fibonacci Tree Algorithm

- Merging Rules: *Best Fit Rule*
  - Pick a parent which minimizes the merge cost **Mcost** of the resulting tree.
  - Merge Cost of tree  $F$

$$\mathbf{Mcost}(F) = \sum_{x \in \{F\text{-root}\}} l(x)$$

# Representative Algorithms

## Fibonacci Tree Algorithm

- Building a Merge Tree: COST
  - $O(n^2)$  ← Dynamic Programming + *Monotonicity*

$$M(i,j) = \min_{i < k < j} \{M(i,k-1) + M(k,j) + (2t_j - t_k - t_i)\}$$

$$M(i,i) = 0$$

Arrivals:  $t_1, t_2, \dots, t_n$

$(i,k-1)$ : Sub-tree of all arrivals prior to  $k$  (*incl* root(T))

$(k,j)$ : Sub-tree rooted at  $k$

$(2t_j - t_k - t_i)$ : length of the stream started at  $k$

# Representative Algorithms

## Fibonacci Tree Algorithm

- How Many Channels?
  - Medium Length:  $L$
  - Arrivals :  $t_1, t_2, \dots, t_n$
  - Span:  $N = t_n - t_1$
  - Density  $\rho$  :  $n/N$ 
    - Density of  $n$  arrivals over  $N$

# Representative Algorithms

## Fibonacci Tree Algorithm

- Density  $\rho : 0 < \rho \leq 1$ 
  - Worst Case:  $\rho$  close to 0
    - very few arrivals over  $N$
    - Each arrival gets a full stream
    - Number of full Streams:  $O(nL)$
  - Best Case:  $\rho$  close to 1
    - many merging activities
    - Number of full Streams:  $O(N \log(\rho L))$  <<Detail in Appendix>>

# Representative Algorithms

## Dyadic Tree Algorithm

- 2-Dyadic Model: *Merge Rules*
  - Start Rule
    - Arrival Times:  $t_0, \dots, t_i, \dots, t_n$  ( $t_0 = 0$ )
      - $t_i \geq L/2 \rightarrow$  new tree
      - $t_i < L/2 \rightarrow$  child in dyadic intervals of  $t_0$

# Representative Algorithms

## Dyadic Tree Algorithm

- 2-Dyadic Model: *Merge Rules*
  - Medium Length:  $L$
  - Partition  $L$  into 2-dyadic intervals:  $I_i$

# Representative Algorithms

## Dyadic Tree Algorithm

### ■ 2-Dyadic Model: *Merge Rules*

- Arrival Times:  $t_0, \dots, t_i, \dots, t_n$  ( $t_0 = 0$ )
- If  $t =$  first arrival in  $I_i \rightarrow$  label  $t$  with  $i$ .
- If  $t = k^{\text{th}}$  arrival in  $I_i \rightarrow$  label  $t$  with  $ik$ .
- Recursively label all arrivals

# Representative Algorithms

## Dyadic Tree Algorithm

### ■ 2-Dyadic Model: *Merge Rule Example*

# Representative Algorithms

## Dyadic Tree Algorithm

### ■ $\phi$ -dyadic Model: *Generalized Intervals*

#### 2-Dyadic Intervals

#### Generalized Intervals

# Representative Algorithms

## Dyadic Tree Algorithm

- $\phi$ -dyadic Model: *Generalized Intervals*
  - Value of  $\alpha$ 
    - 2-Dyadic: 2
      - Coffman *et al.*
    - $\phi$ -Dyadic:  $(1+\sqrt{5})/2$ 
      - Bar-Noy *et al.*
      - 20 hour experiment:
        - $L$ : 1-hour
        - Poisson with a mean interval arrival rate of 1 second
        - $\alpha$ : 1.2 – 2.4 in increment of 0.01
        - Best  $\alpha = 1.65$  (by means of the least # of streams)

# Extension

- Stream Merging vs. Broadcasting
  - Common:
    - Reduce Server Bandwidth.
    - Minimize Start-up Delay.
    - Partition Medium into Sub-partitions.
    - Use of Multicast.
    - Use of Client Buffer.

# Extension

- **Stream Merging vs. Broadcasting**
  - **Major Difference:**
    - **Start-up Delay**
      - **Stream Merging: Zero Delay**
        - Start a new stream for every new arrival.
      - **Broadcasting: Some Delay (Fixed or Variable)**

# Extension

- Stream Merging vs. Broadcasting
  - Number of Client Arrivals:
    - Channel (Stream) Length
      - Stream Merging: Significant
      - Broadcasting: No Effect
    - Channel Allocation
      - Stream Merging: Significant
      - Broadcasting: No Effect

# Extension

- **Stream Merging vs. Broadcasting**
  - **Page Handling:**
    - **Page Sequence**
      - **Stream Merging: Consecutive Order**
      - **Broadcasting (e.g. Pagoda): Not Consecutive Order**
    - **Page Compaction (more data packed via pages)**
      - **Stream Merging: None**
      - **Broadcasting: Major Benefit**

# Extension

- In the end...
  - Streams: Mostly shorter than full
    - Overall: earlier pages downloaded more often than later pages ← Broadcasting!
  - True Advantages of Stream Merging over Broadcasting?
    - Zero Delay
    - No Batching

# Conclusion

- Stream Merging
  - Good when ZERO Delay absolutely necessary.
- In Reality...
  - Can't have infinite number of streams (channels).
  - Channel Allocation/Scheduling Algorithm:
    - On-line (*i.e.* number of arrivals *unknown*).
    - Optimal Number of Channels :  $O(N \log(pL))$ .

# APPENDIX

## Fibonacci Tree Algorithm

- Upper Bound on Optimal Merge Cost

$$M(i,j) = \min\{M(i,k-1) + M(k,j) + (2t_j - t_k - t_i)\}$$

$$M(i,j) \leq c(t_j - t_k) \log_2(j - i + 1), \quad c = 4 \log_2 e$$

- Optimal Full Cost for Forest F:  $Fcost(F)$

- $Fcost(F) = sL + \sum_{i=1..s} M(m_i)$

- $s =$  number of  $L$ -trees,  $1 \leq i \leq s$

- $m_i =$  cardinality of each  $L$ -tree,  $\sum_{i=1..s} m_i = n$

# APPENDIX

## Fibonacci Tree Algorithm

- $Fcost(F)$

- $$Fcost(F) = sL + \sum_{i=1..s} M(m_i)$$
$$\leq sL + cL \sum_{i=1..s} \log_e m_i$$

- By convexity of function  $\log_e$ :

$$Fcost(F) \leq sL + cL \sum_{i=1..s} \log_e(n/s)$$
$$= sL + csL \log_e(n/s)$$
$$= sL(c \log_e(n/s) + 1)$$

# APPENDIX

## Fibonacci Tree Algorithm

- Natural Upper Bound on  $s$ 
  - $sL(c\log_e(n/s) + 1) = \text{concave}$  as a function of  $s$
  - Global Maximum of  $ce^{-1+1/c}nL$  at  $s = e^{-1+1/c}n$   
 $\rightarrow s \leq 4N / L$
- $Fcost(F) \leq 4N / L(c\log_e(n/(4N/L) + 1))$   
 $\in O(N\log(\rho L))$

# APPENDIX

## Fibonacci Tree Algorithm

- Static Fibonacci Tree Example:  $L = 26$ , 13 arrivals...
