

## UNCERTAINTY

### CHAPTER 13

Chapter 13 1

### Outline

- ◇ Uncertainty
- ◇ Probability
- ◇ Syntax and Semantics
- ◇ Inference
- ◇ Independence and Bayes' Rule

Chapter 13 2

### Uncertainty

Let action  $A_t$  = leave for airport  $t$  minutes before flight  
Will  $A_t$  get me there on time?

Problems:

- 1) partial observability (road state, other drivers' plans, etc.)
- 2) noisy sensors (radio traffic reports)
- 3) uncertainty in action outcomes (flat tire, etc.)
- 4) immense complexity of modelling and predicting traffic

Hence a purely logical approach either

- 1) risks falsehood: " $A_{25}$  will get me there on time"
- or 2) leads to conclusions that are too weak for decision making:  
" $A_{25}$  will get me there on time if there's no accident on the bridge  
and it doesn't rain and my tires remain intact etc etc."

( $A_{140}$  might reasonably be said to get me there on time  
but I'd have to stay overnight in the airport...)

Chapter 13 3

### Methods for handling uncertainty

Default or nonmonotonic logic:

Assume my car does not have a flat tire

Assume  $A_{25}$  works unless contradicted by evidence

Issues: What assumptions are reasonable? How to handle contradiction?

Rules with fudge factors:

$A_{25} \mapsto_{0.3} A_{tAirportOnTime}$

$Sprinkler \mapsto_{0.99} WetGrass$

$WetGrass \mapsto_{0.7} Rain$

Issues: Problems with combination, e.g., *Sprinkler* causes *Rain*??

Probability

Given the available evidence,

$A_{25}$  will get me there on time with probability 0.04

Mahaviracarya (9th C.), Cardano (1565) theory of gambling

(Fuzzy logic handles **degree of truth** NOT uncertainty e.g.,  
*WetGrass* is true to degree 0.2)

Chapter 13 4

### Probability

Probabilistic assertions **summarize** effects of  
laziness: failure to enumerate exceptions, qualifications, etc.  
ignorance: lack of relevant facts, initial conditions, etc.

Subjective or Bayesian probability:

Probabilities relate propositions to one's own state of knowledge

e.g.,  $P(A_{25} | \text{no reported accidents}) = 0.06$

These are **not** claims of a "probabilistic tendency" in the current situation  
(but might be learned from past experience of similar situations)

Probabilities of propositions change with new evidence:

e.g.,  $P(A_{25} | \text{no reported accidents, 5 a.m.}) = 0.15$

(Analogous to logical entailment status  $KB \models \alpha$ , not truth.)

Chapter 13 5

### Making decisions under uncertainty

Suppose I believe the following:

$$P(A_{25} \text{ gets me there on time} | \dots) = 0.04$$

$$P(A_{40} \text{ gets me there on time} | \dots) = 0.70$$

$$P(A_{120} \text{ gets me there on time} | \dots) = 0.95$$

$$P(A_{140} \text{ gets me there on time} | \dots) = 0.9999$$

Which action to choose?

Depends on my preferences for missing flight vs. airport cuisine, etc.

Utility theory is used to represent and infer preferences

Decision theory = utility theory + probability theory

Chapter 13 6

## Probability basics

Begin with a set  $\Omega$ —the sample space

e.g., 6 possible rolls of a die.

$\omega \in \Omega$  is a sample point/possible world/atomic event

A probability space or probability model is a sample space

with an assignment  $P(\omega)$  for every  $\omega \in \Omega$  s.t.

$$0 \leq P(\omega) \leq 1$$

$$\sum_{\omega} P(\omega) = 1$$

e.g.,  $P(1) = P(2) = P(3) = P(4) = P(5) = P(6) = 1/6$ .

An event  $A$  is any subset of  $\Omega$

$$P(A) = \sum_{\omega \in A} P(\omega)$$

E.g.,  $P(\text{die roll} < 4) = P(1) + P(2) + P(3) = 1/6 + 1/6 + 1/6 = 1/2$

Chapter 13 7

## Why use probability?

The definitions imply that certain logically related events must have related probabilities

E.g.,  $P(a \vee b) = P(a) + P(b) - P(a \wedge b)$

de Finetti (1931): an agent who bets according to probabilities that violate these axioms can be forced to bet so as to lose money regardless of outcome.

Chapter 13 10

## Random variables

A random variable is a function from sample points to some range, e.g., the reals or Booleans

e.g.,  $Odd(1) = true$ .

$P$  induces a probability distribution for any r.v.  $X$ :

$$P(X = x_i) = \sum_{\omega: X(\omega) = x_i} P(\omega)$$

e.g.,  $P(Odd) = true) = P(1) + P(3) + P(5) = 1/6 + 1/6 + 1/6 = 1/2$

Chapter 13 8

## Propositions

Think of a proposition as the event (set of sample points) where the proposition is true

Given Boolean random variables  $A$  and  $B$ :

event  $a =$  set of sample points where  $A(\omega) = true$

event  $\neg a =$  set of sample points where  $A(\omega) = false$

event  $a \wedge b =$  points where  $A(\omega) = true$  and  $B(\omega) = true$

Often in AI applications, the sample points are **defined**

by the values of a set of random variables, i.e., the

sample space is the Cartesian product of the ranges of the variables

With Boolean variables, sample point = propositional logic model

e.g.,  $A = true, B = false$ , or  $a \wedge \neg b$ .

Proposition = disjunction of atomic events in which it is true

e.g.,  $(a \vee b) \equiv (\neg a \wedge b) \vee (a \wedge \neg b) \vee (a \wedge b)$

$\Rightarrow P(a \vee b) = P(\neg a \wedge b) + P(a \wedge \neg b) + P(a \wedge b)$

Chapter 13 9

## Syntax for propositions

Propositional or Boolean random variables

e.g.,  $Cavity$  (do I have a cavity?)

$Cavity = true$  is a proposition, also written  $cavity$

Discrete random variables (finite or infinite)

e.g.,  $Weather$  is one of  $\{sunny, rain, cloudy, snow\}$

$Weather = rain$  is a proposition

Values must be exhaustive and mutually exclusive

Continuous random variables (bounded or unbounded)

e.g.,  $Temp = 21.6$ ; also allow, e.g.,  $Temp < 22.0$ .

Arbitrary Boolean combinations of basic propositions

Chapter 13 11

## Prior probability

Prior or unconditional probabilities of propositions

e.g.,  $P(Cavity = true) = 0.1$  and  $P(Weather = sunny) = 0.72$

correspond to belief prior to arrival of any (new) evidence

Probability distribution gives values for all possible assignments:

$P(Weather) = \langle 0.72, 0.1, 0.08, 0.1 \rangle$  (normalized, i.e., sums to 1)

Joint probability distribution for a set of r.v.s gives the

probability of every atomic event on those r.v.s (i.e., every sample point)

$P(Weather, Cavity) =$  a  $4 \times 2$  matrix of values:

<i>Weather</i> =	<i>sunny</i>	<i>rain</i>	<i>cloudy</i>	<i>snow</i>
<i>Cavity</i> = <i>true</i>	0.144	0.02	0.016	0.02
<i>Cavity</i> = <i>false</i>	0.576	0.08	0.064	0.08

Every question about a domain can be answered by the joint distribution because every event is a sum of sample points

Chapter 13 12

## Probability for continuous variables

Express distribution as a parameterized function of value:

$P(X = x) = U[18, 26](x)$  = uniform density between 18 and 26

Here  $P$  is a density; integrates to 1.  
 $P(X = 20.5) = 0.125$  really means

$$\lim_{dx \rightarrow 0} P(20.5 \leq X \leq 20.5 + dx)/dx = 0.125$$

Chapter 13 13

## Conditional probability

Definition of conditional probability:

$$P(a|b) = \frac{P(a \wedge b)}{P(b)} \text{ if } P(b) \neq 0$$

Product rule gives an alternative formulation:

$$P(a \wedge b) = P(a|b)P(b) = P(b|a)P(a)$$

A general version holds for whole distributions, e.g.,

$$P(W\text{eather}, Cavity) = P(W\text{eather}|Cavity)P(Cavity)$$

(View as a  $4 \times 2$  set of equations, **not** matrix mult.)

Chain rule is derived by successive application of product rule:

$$P(X_1, \dots, X_n) = P(X_1, \dots, X_{n-1}) P(X_n | X_1, \dots, X_{n-1})$$

Chapter 13 16

## Gaussian density

$$P(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-(x-\mu)^2/2\sigma^2}$$

Chapter 13 14

## Conditional probability

Definition of conditional probability:

$$P(a|b) = \frac{P(a \wedge b)}{P(b)} \text{ if } P(b) \neq 0$$

Product rule gives an alternative formulation:

$$P(a \wedge b) = P(a|b)P(b) = P(b|a)P(a)$$

A general version holds for whole distributions, e.g.,

$$P(W\text{eather}, Cavity) = P(W\text{eather}|Cavity)P(Cavity)$$

(View as a  $4 \times 2$  set of equations, **not** matrix mult.)

Chain rule is derived by successive application of product rule:

$$P(X_1, \dots, X_n) = P(X_1, \dots, X_{n-1}) P(X_n | X_1, \dots, X_{n-1}) \\ = P(X_1, \dots, X_{n-2}) P(X_{n-1} | X_1, \dots, X_{n-2}) P(X_n | X_1, \dots, X_{n-1})$$

Chapter 13 17

## Conditional probability

Conditional or posterior probabilities

e.g.,  $P(cavity|toothache) = 0.8$

i.e. **given that toothache is all I know**

**NOT** "if toothache then 80% chance of cavity"

(Notation for conditional distributions:

$P(Cavity|Toothache)$  = 2-element vector of 2-element vectors)

If we know more, e.g., *cavity* is also given, then we have

$P(cavity|toothache, cavity) = 1$

Note: the less specific belief **remains valid** after more evidence arrives, but is not always **useful**

New evidence may be irrelevant, allowing simplification, e.g.,

$P(cavity|toothache, carnucksWin) = P(cavity|toothache) = 0.8$

This kind of inference, sanctioned by domain knowledge, is crucial

Chapter 13 15

## Conditional probability

Definition of conditional probability:

$$P(a|b) = \frac{P(a \wedge b)}{P(b)} \text{ if } P(b) \neq 0$$

Product rule gives an alternative formulation:

$$P(a \wedge b) = P(a|b)P(b) = P(b|a)P(a)$$

A general version holds for whole distributions, e.g.,

$$P(W\text{eather}, Cavity) = P(W\text{eather}|Cavity)P(Cavity)$$

(View as a  $4 \times 2$  set of equations, **not** matrix mult.)

Chain rule is derived by successive application of product rule:

$$P(X_1, \dots, X_n) = P(X_1, \dots, X_{n-1}) P(X_n | X_1, \dots, X_{n-1}) \\ = P(X_1, \dots, X_{n-2}) P(X_{n-1} | X_1, \dots, X_{n-2}) P(X_n | X_1, \dots, X_{n-1}) \\ = \dots \\ = \prod_{i=1}^n P(X_i | X_1, \dots, X_{i-1})$$

Chapter 13 18

### Inference by enumeration

Start with the joint distribution:

	<i>toothache</i>	$\neg$ <i>toothache</i>
<i>catch</i>	<b>.108</b>	<b>.072</b>
<i>cavity</i>	<b>.016</b>	<b>.064</b>

For any proposition  $\phi$ , sum the atomic events where it is true:  
 $P(\phi) = \sum_{\omega:\omega\models\phi} P(\omega)$

Chapter 13 19

### Inference by enumeration

Start with the joint distribution:

	<i>toothache</i>	$\neg$ <i>toothache</i>
<i>catch</i>	<b>.108</b>	<b>.072</b>
<i>cavity</i>	<b>.016</b>	<b>.064</b>

For any proposition  $\phi$ , sum the atomic events where it is true:  
 $P(\phi) = \sum_{\omega:\omega\models\phi} P(\omega)$   
 $P(\text{toothache}) = 0.108 + 0.012 + 0.016 + 0.064 = 0.2$

Chapter 13 20

### Inference by enumeration

Start with the joint distribution:

	<i>toothache</i>	$\neg$ <i>toothache</i>
<i>catch</i>	<b>.108</b>	<b>.072</b>
<i>cavity</i>	<b>.016</b>	<b>.064</b>

For any proposition  $\phi$ , sum the atomic events where it is true:  
 $P(\phi) = \sum_{\omega:\omega\models\phi} P(\omega)$   
 $P(\text{cavity} \vee \text{toothache}) = ?$

Chapter 13 21

### Inference by enumeration

Start with the joint distribution:

	<i>toothache</i>	$\neg$ <i>toothache</i>
<i>catch</i>	<b>.108</b>	<b>.072</b>
<i>cavity</i>	<b>.016</b>	<b>.064</b>

For any proposition  $\phi$ , sum the atomic events where it is true:  
 $P(\phi) = \sum_{\omega:\omega\models\phi} P(\omega)$   
 $P(\text{cavity} \vee \text{toothache}) = 0.108 + 0.012 + 0.072 + 0.008 + 0.016 + 0.064 = 0.28$

Chapter 13 22

### Inference by enumeration

Start with the joint distribution:

	<i>toothache</i>	$\neg$ <i>toothache</i>
<i>catch</i>	<b>.108</b>	<b>.072</b>
<i>cavity</i>	<b>.016</b>	<b>.064</b>

Can also compute conditional probabilities:  
 $P(\neg\text{cavity}|\text{toothache}) = ?$

Chapter 13 23

### Inference by enumeration

Start with the joint distribution:

	<i>toothache</i>	$\neg$ <i>toothache</i>
<i>catch</i>	<b>.108</b>	<b>.072</b>
<i>cavity</i>	<b>.016</b>	<b>.064</b>

Can also compute conditional probabilities:  
 $P(\neg\text{cavity}|\text{toothache}) = \frac{P(\neg\text{cavity} \wedge \text{toothache})}{P(\text{toothache})}$

Chapter 13 24

### Inference by enumeration

Start with the joint distribution:

	<i>toothache</i>		$\neg$ <i>toothache</i>	
	<i>catch</i>	$\neg$ <i>catch</i>	<i>catch</i>	$\neg$ <i>catch</i>
<i>cavity</i>	<b>.108</b>	<b>.012</b>	<b>.072</b>	<b>.008</b>
$\neg$ <i>cavity</i>	<b>.016</b>	<b>.064</b>	<b>.144</b>	<b>.576</b>

Can also compute conditional probabilities:

$$\begin{aligned}
 P(\neg\text{cavity}|\text{toothache}) &= \frac{P(\neg\text{cavity} \wedge \text{toothache})}{P(\text{toothache})} \\
 &= \frac{0.016 + 0.064}{0.108 + 0.012 + 0.016 + 0.064} = 0.4
 \end{aligned}$$

Chapter 13 25

### Normalization

	<i>toothache</i>		$\neg$ <i>toothache</i>	
	<i>catch</i>	$\neg$ <i>catch</i>	<i>catch</i>	$\neg$ <i>catch</i>
<i>cavity</i>	<b>.108</b>	<b>.012</b>	<b>.072</b>	<b>.008</b>
$\neg$ <i>cavity</i>	<b>.016</b>	<b>.064</b>	<b>.144</b>	<b>.576</b>

Denominator can be viewed as a normalization constant  $\alpha$

$$P(\text{Cavity}|\text{toothache}) = \frac{P(\text{Cavity}, \text{toothache})}{P(\text{toothache})} = \alpha P(\text{Cavity}, \text{toothache})$$

Chapter 13 26

### Normalization

	<i>toothache</i>		$\neg$ <i>toothache</i>	
	<i>catch</i>	$\neg$ <i>catch</i>	<i>catch</i>	$\neg$ <i>catch</i>
<i>cavity</i>	<b>.108</b>	<b>.012</b>	<b>.072</b>	<b>.008</b>
$\neg$ <i>cavity</i>	<b>.016</b>	<b>.064</b>	<b>.144</b>	<b>.576</b>

Denominator can be viewed as a normalization constant  $\alpha$

$$\begin{aligned}
 P(\text{Cavity}|\text{toothache}) &= \frac{P(\text{Cavity}, \text{toothache})}{P(\text{toothache})} = \alpha P(\text{Cavity}, \text{toothache}) \\
 &= \alpha [P(\text{Cavity}, \text{toothache}, \text{catch}) + P(\text{Cavity}, \text{toothache}, \neg\text{catch})]
 \end{aligned}$$

Chapter 13 27

### Normalization

	<i>toothache</i>		$\neg$ <i>toothache</i>	
	<i>catch</i>	$\neg$ <i>catch</i>	<i>catch</i>	$\neg$ <i>catch</i>
<i>cavity</i>	<b>.108</b>	<b>.012</b>	<b>.072</b>	<b>.008</b>
$\neg$ <i>cavity</i>	<b>.016</b>	<b>.064</b>	<b>.144</b>	<b>.576</b>

Denominator can be viewed as a normalization constant  $\alpha$

$$\begin{aligned}
 P(\text{Cavity}|\text{toothache}) &= \frac{P(\text{Cavity}, \text{toothache})}{P(\text{toothache})} = \alpha P(\text{Cavity}, \text{toothache}) \\
 &= \alpha [P(\text{Cavity}, \text{toothache}, \text{catch}) + P(\text{Cavity}, \text{toothache}, \neg\text{catch})] \\
 &= \alpha [(0.108, 0.016) + (0.012, 0.064)]
 \end{aligned}$$

Chapter 13 28

### Normalization

	<i>toothache</i>		$\neg$ <i>toothache</i>	
	<i>catch</i>	$\neg$ <i>catch</i>	<i>catch</i>	$\neg$ <i>catch</i>
<i>cavity</i>	<b>.108</b>	<b>.012</b>	<b>.072</b>	<b>.008</b>
$\neg$ <i>cavity</i>	<b>.016</b>	<b>.064</b>	<b>.144</b>	<b>.576</b>

Denominator can be viewed as a normalization constant  $\alpha$

$$\begin{aligned}
 P(\text{Cavity}|\text{toothache}) &= \frac{P(\text{Cavity}, \text{toothache})}{P(\text{toothache})} = \alpha P(\text{Cavity}, \text{toothache}) \\
 &= \alpha [P(\text{Cavity}, \text{toothache}, \text{catch}) + P(\text{Cavity}, \text{toothache}, \neg\text{catch})] \\
 &= \alpha [(0.108, 0.016) + (0.012, 0.064)] \\
 &= \alpha (0.12, 0.08) = \langle 0.6, 0.4 \rangle
 \end{aligned}$$

Chapter 13 29

### Normalization

	<i>toothache</i>		$\neg$ <i>toothache</i>	
	<i>catch</i>	$\neg$ <i>catch</i>	<i>catch</i>	$\neg$ <i>catch</i>
<i>cavity</i>	<b>.108</b>	<b>.012</b>	<b>.072</b>	<b>.008</b>
$\neg$ <i>cavity</i>	<b>.016</b>	<b>.064</b>	<b>.144</b>	<b>.576</b>

Denominator can be viewed as a normalization constant  $\alpha$

$$\begin{aligned}
 P(\text{Cavity}|\text{toothache}) &= \frac{P(\text{Cavity}, \text{toothache})}{P(\text{toothache})} = \alpha P(\text{Cavity}, \text{toothache}) \\
 &= \alpha [P(\text{Cavity}, \text{toothache}, \text{catch}) + P(\text{Cavity}, \text{toothache}, \neg\text{catch})] \\
 &= \alpha [(0.108, 0.016) + (0.012, 0.064)] \\
 &= \alpha (0.12, 0.08) = \langle 0.6, 0.4 \rangle
 \end{aligned}$$

General idea: compute distribution on query variable by fixing evidence variables and summing over hidden variables

Chapter 13 30

### Inference by enumeration, contd.

Let  $\mathbf{X}$  be all the variables. Typically, we want the posterior joint distribution of the query variables  $\mathbf{Y}$  given specific values  $\mathbf{e}$  for the evidence variables  $\mathbf{E}$

Let the hidden variables be  $\mathbf{H} = \mathbf{X} - \mathbf{Y} - \mathbf{E}$

Then the required summation of joint entries is done by summing out the hidden variables:

$$\mathbf{P}(\mathbf{Y}|\mathbf{E} = \mathbf{e}) = \alpha \mathbf{P}(\mathbf{Y}, \mathbf{E} = \mathbf{e}) = \alpha \sum_{\mathbf{H}} \mathbf{P}(\mathbf{Y}, \mathbf{E} = \mathbf{e}, \mathbf{H} = \mathbf{h})$$

The terms in the summation are joint entries because  $\mathbf{Y}$ ,  $\mathbf{E}$ , and  $\mathbf{H}$  together exhaust the set of random variables

Obvious problems:

- 1) Worst-case time complexity  $O(d^n)$  where  $d$  is the largest arity
- 2) Space complexity  $O(d^n)$  to store the joint distribution
- 3) How to find the numbers for  $O(d^n)$  entries???

Chap19 33

### Conditional independence contd.

Write out full joint distribution using chain rule:

$$\begin{aligned} & \mathbf{P}(\text{Toothache}, \text{Catch}, \text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Catch}, \text{Cavity})\mathbf{P}(\text{Catch}, \text{Cavity}) \end{aligned}$$

Chap19 34

### Independence

$A$  and  $B$  are independent iff  $\mathbf{P}(A|B) = \mathbf{P}(A)$  or  $\mathbf{P}(B|A) = \mathbf{P}(B)$  or  $\mathbf{P}(A, B) = \mathbf{P}(A)\mathbf{P}(B)$

$\mathbf{P}(\text{Toothache}, \text{Catch}, \text{Cavity}, \text{Weather}) = \mathbf{P}(\text{Toothache}, \text{Catch}, \text{Cavity})\mathbf{P}(\text{Weather})$

32 entries reduced to 12; for  $n$  independent biased coins,  $2^n \rightarrow n$

Absolute independence powerful but rare

Dentistry is a large field with hundreds of variables, none of which are independent. What to do?

Chap19 33

### Conditional independence contd.

Write out full joint distribution using chain rule:

$$\begin{aligned} & \mathbf{P}(\text{Toothache}, \text{Catch}, \text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Catch}, \text{Cavity})\mathbf{P}(\text{Catch}, \text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Catch}, \text{Cavity})\mathbf{P}(\text{Catch}|\text{Cavity})\mathbf{P}(\text{Cavity}) \end{aligned}$$

Chap19 35

### Conditional independence

$\mathbf{P}(\text{Toothache}, \text{Cavity}, \text{Catch})$  has  $2^3 - 1 = 7$  independent entries

If I have a cavity, the probability that the probe catches in it doesn't depend on whether I have a toothache:

$$(1) \mathbf{P}(\text{catch}|\text{toothache}, \text{cavity}) = \mathbf{P}(\text{catch}|\text{cavity})$$

The same independence holds if I haven't got a cavity:

$$(2) \mathbf{P}(\text{catch}|\text{toothache}, \neg \text{cavity}) = \mathbf{P}(\text{catch}|\neg \text{cavity})$$

*Catch* is conditionally independent of *Toothache* given *Cavity*:

$$\mathbf{P}(\text{Catch}|\text{Toothache}, \text{Cavity}) = \mathbf{P}(\text{Catch}|\text{Cavity})$$

Equivalent statements:

$$\mathbf{P}(\text{Toothache}|\text{Catch}, \text{Cavity}) = \mathbf{P}(\text{Toothache}|\text{Cavity})$$

$$\mathbf{P}(\text{Toothache}, \text{Catch}|\text{Cavity}) = \mathbf{P}(\text{Toothache}|\text{Cavity})\mathbf{P}(\text{Catch}|\text{Cavity})$$

### Conditional independence contd.

Write out full joint distribution using chain rule:

$$\begin{aligned} & \mathbf{P}(\text{Toothache}, \text{Catch}, \text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Catch}, \text{Cavity})\mathbf{P}(\text{Catch}, \text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Catch}, \text{Cavity})\mathbf{P}(\text{Catch}|\text{Cavity})\mathbf{P}(\text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Cavity})\mathbf{P}(\text{Catch}|\text{Cavity})\mathbf{P}(\text{Cavity}) \end{aligned}$$

How many independent numbers?

Chap19 33

Chap19 36

### Conditional independence contd.

Write out full joint distribution using chain rule:

$$\begin{aligned} & \mathbf{P}(\text{Toothache}, \text{Catch}, \text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Catch}, \text{Cavity})\mathbf{P}(\text{Catch}, \text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Catch}, \text{Cavity})\mathbf{P}(\text{Catch}|\text{Cavity})\mathbf{P}(\text{Cavity}) \\ &= \mathbf{P}(\text{Toothache}|\text{Cavity})\mathbf{P}(\text{Catch}|\text{Cavity})\mathbf{P}(\text{Cavity}) \end{aligned}$$

$2 + 2 + 1 = 5$  independent numbers

In many cases, the use of conditional independence reduces the size of the representation of the joint distribution from exponential in  $n$  to linear in  $n$ .

**Conditional independence is our most basic and robust form of knowledge about uncertain environments.**

Chapter 13 37

### Bayes' Rule and conditional independence

$$\begin{aligned} & \mathbf{P}(\text{Cavity}|\text{toothache} \wedge \text{catch}) \\ &= \mathbf{P}(\text{toothache} \wedge \text{catch}|\text{Cavity})\mathbf{P}(\text{Cavity})/P(\text{toothache} \wedge \text{catch}) \end{aligned}$$

Chapter 13 40

### Bayes' Rule

Product rule  $P(a \wedge b) = P(a|b)P(b) = P(b|a)P(a)$

$$\Rightarrow \text{Bayes' rule } P(a|b) = \frac{P(b|a)P(a)}{P(b)}$$

or in distribution form

$$\mathbf{P}(Y|X) = \frac{\mathbf{P}(X|Y)\mathbf{P}(Y)}{\mathbf{P}(X)} = \alpha\mathbf{P}(X|Y)\mathbf{P}(Y)$$

Useful for assessing **diagnostic probability from causal probability**:

$$\mathbf{P}(\text{Cause}|\text{Effect}) = \frac{\mathbf{P}(\text{Effect}|\text{Cause})\mathbf{P}(\text{Cause})}{\mathbf{P}(\text{Effect})}$$

E.g., let  $M$  be meningitis,  $S$  be stiff neck:

$$P(m|s) = ?$$

Chapter 13 38

### Bayes' Rule and conditional independence

$$\begin{aligned} & \mathbf{P}(\text{Cavity}|\text{toothache} \wedge \text{catch}) \\ &= \mathbf{P}(\text{toothache} \wedge \text{catch}|\text{Cavity})\mathbf{P}(\text{Cavity})/P(\text{toothache} \wedge \text{catch}) \\ &= \alpha\mathbf{P}(\text{toothache} \wedge \text{catch}|\text{Cavity})\mathbf{P}(\text{Cavity}) \end{aligned}$$

Chapter 13 41

### Bayes' Rule

Product rule  $P(a \wedge b) = P(a|b)P(b) = P(b|a)P(a)$

$$\Rightarrow \text{Bayes' rule } P(a|b) = \frac{P(b|a)P(a)}{P(b)}$$

or in distribution form

$$\mathbf{P}(Y|X) = \frac{\mathbf{P}(X|Y)\mathbf{P}(Y)}{\mathbf{P}(X)} = \alpha\mathbf{P}(X|Y)\mathbf{P}(Y)$$

Useful for assessing **diagnostic probability from causal probability**:

$$\mathbf{P}(\text{Cause}|\text{Effect}) = \frac{\mathbf{P}(\text{Effect}|\text{Cause})\mathbf{P}(\text{Cause})}{\mathbf{P}(\text{Effect})}$$

E.g., let  $M$  be meningitis,  $S$  be stiff neck:

$$P(m|s) = \frac{P(s|m)P(m)}{P(s)} = \frac{0.8 \times 0.0001}{0.1} = 0.0008$$

Note: posterior probability of meningitis still very small!

Chapter 13 39

### Bayes' Rule and conditional independence

$$\begin{aligned} & \mathbf{P}(\text{Cavity}|\text{toothache} \wedge \text{catch}) \\ &= \mathbf{P}(\text{toothache} \wedge \text{catch}|\text{Cavity})\mathbf{P}(\text{Cavity})/P(\text{toothache} \wedge \text{catch}) \\ &= \alpha\mathbf{P}(\text{toothache} \wedge \text{catch}|\text{Cavity})\mathbf{P}(\text{Cavity}) \\ &= \alpha\mathbf{P}(\text{toothache}|\text{Cavity})\mathbf{P}(\text{catch}|\text{Cavity})\mathbf{P}(\text{Cavity}) \end{aligned}$$

Chapter 13 42

## Bayes' Rule and conditional independence

$$\begin{aligned} & \mathbf{P}(Cavity|toothache \wedge catch) \\ &= \mathbf{P}(toothache \wedge catch|Cavity) \mathbf{P}(Cavity) / \mathbf{P}(toothache \wedge catch) \\ &= \alpha \mathbf{P}(toothache \wedge catch|Cavity) \mathbf{P}(Cavity) \\ &= \alpha \mathbf{P}(toothache|Cavity) \mathbf{P}(catch|Cavity) \mathbf{P}(Cavity) \end{aligned}$$

This is an example of a naive Bayes model:

$$\mathbf{P}(Cause, Effect_1, \dots, Effect_n) = \mathbf{P}(Cause) \prod_i \mathbf{P}(Effect_i|Cause)$$

Total number of parameters is **linear** in  $n$

Chapter 13 43

## Specifying the probability model

The full joint distribution is  $\mathbf{P}(P_{1,1}, \dots, P_{4,4}, B_{1,1}, B_{1,2}, B_{2,1})$

Apply product rule:  $\mathbf{P}(B_{1,1}, B_{1,2}, B_{2,1} | P_{1,1}, \dots, P_{4,4}) \mathbf{P}(P_{1,1}, \dots, P_{4,4})$

(Do it this way to get  $\mathbf{P}(Effect|Cause)$ )

First term: 1 if pits are adjacent to breezes, 0 otherwise

Second term: pits are placed randomly, probability 0.2 per square:

$$\mathbf{P}(P_{1,1}, \dots, P_{4,4}) = \prod_{i,j=1,1}^{4,4} \mathbf{P}(P_{i,j}) = 0.2^{2^4} \times 0.8^{16-2^4}$$

for  $n$  pits:

Chapter 13 46

## Observations and query

We know the following facts:

$$b = \neg b_{1,1} \wedge b_{1,2} \wedge b_{2,1}$$

$$known = \neg p_{1,1} \wedge \neg p_{1,2} \wedge \neg p_{2,1}$$

Query is  $\mathbf{P}(P_{1,3}|known, b)$

Define *Unknown* =  $P_{ij}$ s other than  $P_{1,3}$  and *Known*

For inference by enumeration, we have

$$\mathbf{P}(P_{1,3}|known, b) = \alpha \sum_{unknown} \mathbf{P}(P_{1,3}, unknown, known, b)$$

Grows exponentially with number of squares!

Chapter 13 47

## Wumpus World

1,4	2,4	3,4	4,4
1,3	2,3	3,3	4,3
1,2	2,2	3,2	4,2
1,1	2,1	3,1	4,1
OK	B	OK	

$P_{ij} = true$  iff  $[i, j]$  contains a pit

$B_{ij} = true$  iff  $[i, j]$  is breezy

Include only  $B_{1,1}, B_{1,2}, B_{2,1}$  in the probability model

Chapter 13 48

## Specifying the probability model

The full joint distribution is  $\mathbf{P}(P_{1,1}, \dots, P_{4,4}, B_{1,1}, B_{1,2}, B_{2,1})$

Apply product rule:  $\mathbf{P}(B_{1,1}, B_{1,2}, B_{2,1} | P_{1,1}, \dots, P_{4,4}) \mathbf{P}(P_{1,1}, \dots, P_{4,4})$

(Do it this way to get  $\mathbf{P}(Effect|Cause)$ )

First term: 1 if pits are adjacent to breezes, 0 otherwise

Second term: pits are placed randomly, probability 0.2 per square:

$$\mathbf{P}(P_{1,1}, \dots, P_{4,4}) = ?$$

Chapter 13 43

## Using conditional independence

Basic insight: observations are conditionally independent of other hidden squares given neighbouring hidden squares

Define *Unknown* = *Fringe*  $\cup$  *Other*

$$\mathbf{P}(b|P_{1,3}, Known, Unknown) = \mathbf{P}(b|P_{1,3}, Known, Fringe)$$

Manipulate query into a form where we can use this!

Chapter 13 48

**Using conditional independence contd.**

$$\mathbf{P}(P_{1,3}|known, b) = \alpha \sum_{unknown} \mathbf{P}(P_{1,3}, unknown, known, b)$$

Chapter 13 49

**Using conditional independence contd.**

$$\begin{aligned} \mathbf{P}(P_{1,3}|known, b) &= \alpha \sum_{unknown} \mathbf{P}(P_{1,3}, unknown, known, b) \\ &= \alpha \sum_{unknown} \mathbf{P}(\beta|P_{1,3}, known, unknown) \mathbf{P}(P_{1,3}, known, unknown) \\ &= \alpha \sum_{fringe, other} \mathbf{P}(\beta|known, P_{1,3}, fringe, other) \mathbf{P}(P_{1,3}, known, fringe, other) \\ &= \alpha \sum_{fringe, other} \mathbf{P}(\beta|known, P_{1,3}, fringe) \mathbf{P}(P_{1,3}, known, fringe, other) \end{aligned}$$

Chapter 13 52

**Using conditional independence contd.**

$$\begin{aligned} \mathbf{P}(P_{1,3}|known, b) &= \alpha \sum_{unknown} \mathbf{P}(P_{1,3}, unknown, known, b) \\ &= \alpha \sum_{unknown} \mathbf{P}(\beta|P_{1,3}, known, unknown) \mathbf{P}(P_{1,3}, known, unknown) \end{aligned}$$

Chapter 13 50

**Using conditional independence contd.**

$$\begin{aligned} \mathbf{P}(P_{1,3}|known, b) &= \alpha \sum_{unknown} \mathbf{P}(P_{1,3}, unknown, known, b) \\ &= \alpha \sum_{unknown} \mathbf{P}(\beta|P_{1,3}, known, unknown) \mathbf{P}(P_{1,3}, known, unknown) \\ &= \alpha \sum_{fringe, other} \mathbf{P}(\beta|known, P_{1,3}, fringe, other) \mathbf{P}(P_{1,3}, known, fringe, other) \\ &= \alpha \sum_{fringe, other} \mathbf{P}(\beta|known, P_{1,3}, fringe) \mathbf{P}(P_{1,3}, known, fringe, other) \\ &= \alpha \sum_{fringe} \mathbf{P}(\beta|known, P_{1,3}, fringe) \sum_{other} \mathbf{P}(P_{1,3}, known, fringe, other) \end{aligned}$$

Chapter 13 53

**Using conditional independence contd.**

$$\begin{aligned} \mathbf{P}(P_{1,3}|known, b) &= \alpha \sum_{unknown} \mathbf{P}(P_{1,3}, unknown, known, b) \\ &= \alpha \sum_{unknown} \mathbf{P}(\beta|P_{1,3}, known, unknown) \mathbf{P}(P_{1,3}, known, unknown) \\ &= \alpha \sum_{fringe, other} \mathbf{P}(\beta|known, P_{1,3}, fringe, other) \mathbf{P}(P_{1,3}, known, fringe, other) \end{aligned}$$

Chapter 13 54

**Using conditional independence contd.**

$$\begin{aligned} \mathbf{P}(P_{1,3}|known, b) &= \alpha \sum_{unknown} \mathbf{P}(P_{1,3}, unknown, known, b) \\ &= \alpha \sum_{unknown} \mathbf{P}(\beta|P_{1,3}, known, unknown) \mathbf{P}(P_{1,3}, known, unknown) \\ &= \alpha \sum_{fringe, other} \mathbf{P}(\beta|known, P_{1,3}, fringe, other) \mathbf{P}(P_{1,3}, known, fringe, other) \\ &= \alpha \sum_{fringe, other} \mathbf{P}(\beta|known, P_{1,3}, fringe) \mathbf{P}(P_{1,3}, known, fringe, other) \\ &= \alpha \sum_{fringe} \mathbf{P}(\beta|known, P_{1,3}, fringe) \sum_{other} \mathbf{P}(P_{1,3}, known, fringe, other) \\ &= \alpha \sum_{fringe} \mathbf{P}(\beta|known, P_{1,3}, fringe) \sum_{other} \mathbf{P}(P_{1,3}) P(known) P(fringe) P(other) \end{aligned}$$

Chapter 13 54

### Using conditional independence contd.

$$\begin{aligned}
 P(P_{1,3}|known, b) &= \alpha \sum_{unknown} P(P_{1,3}, unknown, known, b) \\
 &= \alpha \sum_{unknown} P(b|P_{1,3}, known, unknown)P(P_{1,3}, known, unknown) \\
 &= \alpha \sum_{fringe\ other} P(b|known, P_{1,3}, fringe, other)P(P_{1,3}, known, fringe, other) \\
 &= \alpha \sum_{fringe\ other} P(b|known, P_{1,3}, fringe)P(P_{1,3}, known, fringe, other) \\
 &= \alpha \sum_{fringe} P(b|known, P_{1,3}, fringe) \sum_{other} P(P_{1,3}, known, fringe, other) \\
 &= \alpha \sum_{fringe} P(b|known, P_{1,3}, fringe) \sum_{other} P(P_{1,3})P(known)P(fringe)P(other) \\
 &= \alpha P(known)P(P_{1,3}) \sum_{fringe} P(b|known, P_{1,3}, fringe)P(fringe) \sum_{other} P(other)
 \end{aligned}$$

Chapter 13 55

### Using conditional independence contd.

0.2 x 0.2 = 0.04

0.2 x 0.8 = 0.16

0.8 x 0.2 = 0.16

0.2 x 0.2 = 0.04

0.2 x 0.8 = 0.16

$$P(P_{1,3}|known, b) = \alpha' (0.2(0.04 + 0.16 + 0.16), 0.8(0.04 + 0.16)) \approx (0.31, 0.69)$$

$$P(P_{2,2}|known, b) = (??, ??)$$

Chapter 13 56

### Using conditional independence contd.

$$\begin{aligned}
 P(P_{1,3}|known, b) &= \alpha \sum_{unknown} P(P_{1,3}, unknown, known, b) \\
 &= \alpha \sum_{unknown} P(b|P_{1,3}, known, unknown)P(P_{1,3}, known, unknown) \\
 &= \alpha \sum_{fringe\ other} P(b|known, P_{1,3}, fringe, other)P(P_{1,3}, known, fringe, other) \\
 &= \alpha \sum_{fringe\ other} P(b|known, P_{1,3}, fringe)P(P_{1,3}, known, fringe, other) \\
 &= \alpha \sum_{fringe} P(b|known, P_{1,3}, fringe) \sum_{other} P(P_{1,3}, known, fringe, other) \\
 &= \alpha \sum_{fringe} P(b|known, P_{1,3}, fringe) P(known)P(fringe)P(other) \\
 &= \alpha P(known)P(P_{1,3}) \sum_{fringe} P(b|known, P_{1,3}, fringe)P(fringe) \sum_{other} P(other) \\
 &= \alpha' P(P_{1,3}) \sum_{fringe} P(b|known, P_{1,3}, fringe)P(fringe)
 \end{aligned}$$

Chapter 13 56

$$\begin{aligned}
 P(P_{1,3}|known, b) &= \alpha' (0.2(0.04 + 0.16 + 0.16), 0.8(0.04 + 0.16)) \\
 &\approx (0.31, 0.69) \\
 P(P_{2,2}|known, b) &= \alpha' (0.2(0.04 + 0.16 + 0.16 + 0.64), 0.8(0.04)) \\
 P(P_{2,2}|known, b) &\approx (0.86, 0.14)
 \end{aligned}$$

Chapter 13 56

### Using conditional independence contd.

0.2 x 0.2 = 0.04

0.2 x 0.8 = 0.16

0.8 x 0.2 = 0.16

0.2 x 0.2 = 0.04

0.2 x 0.8 = 0.16

$$P(P_{1,3}|known, b) = (??, ??)$$

Chapter 13 57

### Summary

- Probability is a rigorous formalism for uncertain knowledge
- Joint probability distribution specifies probability of every atomic event
- Queries can be answered by summing over atomic events
- For nontrivial domains, we must find a way to reduce the joint size
- Independence and conditional independence provide the tools

Chapter 13 60
